

Turn scattered field and supplier data into a **decision-ready** knowledge base

The Problem

Your quality knowledge — warranty claims, field reports, supplier 8D reports, audit findings, countermeasure records — is scattered across dealer systems, supplier portals, and Excel files, and locked in your veteran engineers' heads. Connecting a field failure to the responsible lot and supplier takes weeks; recall judgment depends on incomplete pictures.

What Neuron Does

It links every record into one ontology-structured database anchored to each VIN and part lot number, so your team gets instant answers to "which vehicles carry this lot?" and "has this supplier shown this failure mode before?" — without changing how you work today.

What you can do with the centralized database

01

Detect field-failure signs before they scale

Flag part lots whose early warranty claims trend toward past-recall patterns, so containment starts at hundreds of vehicles — not hundreds of thousands.

02

Check risk at the lot and supplier level

When one claim comes in, instantly see every affected VIN, plant, and model sharing the same lot or supplier process and judge the full exposure.

03

Verify countermeasures actually worked

Track whether the same failure mode recurred across models, plants, and suppliers after each corrective action — evidence you can show OEM customers and regulators.

04

Make launch and shipment decisions with full context

Surface similar past field issues and supplier history at judgment time, so nothing gets missed at SOP or shipping release.

"Tracing one field claim back through supplier lots used to take three weeks of emails. Now the affected population is on screen the same day."

Supplier Quality Manager - Tier-1 automotive supplier

See it with your own data

We start with a focused PoC using your existing quality files — warranty exports, 8D reports, inspection sheets, as they are. No system migration, no process change required.
