

Turn scattered customer feedback into a **decision-ready** knowledge base

The Problem

Your product knowledge — returns data, reviews, VOC comments, supplier QC reports, customer service logs — is scattered across marketplaces, storefronts, and vendor spreadsheets, and locked in your veteran merchandisers' heads. Connecting a review spike to its supplier lot takes weeks; buying decisions run on gut feel.

What Neuron Does

It links every record into one ontology-structured database anchored to each SKU and order ID, so your team gets instant answers to "why is this SKU really coming back?" and "which other products share this supplier issue?" — without changing how you work today.

What you can do with the centralized database

01

Detect return signs before they scale

Flag SKUs whose early reviews and CS contacts trend toward past high-return patterns — sizing, materials, packaging — so fixes happen in the first hundred units.

02

Check exposure across categories and suppliers

When one SKU shows a defect, instantly see every product sharing the same supplier, factory, or material and judge the full margin impact.

03

Verify fixes actually cut returns

Track whether return and complaint rates actually dropped after each spec change, vendor switch, or listing update — evidence for supplier negotiations.

04

Make buying decisions with full context

Surface each product's complete return and complaint history — and its category's patterns — at range review, so reorders and delistings rest on evidence.

"A sizing complaint pattern we'd fixed in one category showed up untouched in two others — same factory. One search now shows the whole picture."

Head of Merchandising - Online retailer

See it with your own data

We start with a focused PoC using your existing data — returns exports, reviews, supplier reports, as they are. No system migration, no process change required.
