

Turn scattered student records into a **decision-ready** knowledge base

The Problem

Your support knowledge — advising notes, attendance patterns, incident reports, accommodation records, program reviews — is scattered across LMS exports, counseling files, and departmental folders, and locked in individual advisors' heads. Spotting a struggling student across systems takes weeks; support quality depends on who happens to notice.

What Neuron Does

It links every record into one ontology-structured database anchored to each student and case ID, so your team gets instant answers to "which students show patterns that preceded past withdrawals?" and "what interventions worked for similar cases?" — without changing how you work today.

What you can do with the centralized database

01

Detect at-risk signs before withdrawal

Flag students whose attendance, submission, and engagement patterns trend toward past-dropout profiles, so outreach starts in week three — not after the withdrawal form.

02

Check patterns at the cohort level

When one student struggles in a course, instantly see whether the pattern spans the section, the cohort, or the curriculum and judge where the real problem sits.

03

Verify interventions actually worked

Track whether tutoring, advising, and accommodation measures improved outcomes for similar cases — evidence for accreditation and program review.

04

Support students with full context

Surface each student's full history and similar past cases at advising time, so no student has to re-explain their situation to a fifth staff member.

"A student's early-warning signs were sitting in three separate systems that never talked. Now the pattern shows up on one screen — early enough to act."

Dean of Student Success - Private university

See it with your own data

We start with a focused PoC using your existing records — advising notes, LMS exports, program reviews, as they are. No system migration, no process change required.
