

Turn scattered risk records into a **decision-ready** knowledge base

The Problem

Your risk knowledge — audit findings, incident reports, complaint logs, regulatory correspondence, remediation plans — is scattered across departments, spreadsheets, and archived emails, and locked in your senior compliance officers' heads. Reconstructing how a similar issue was handled takes days; consistency depends on who reviews the case.

What Neuron Does

It links every record into one ontology-structured database anchored to each case and account ID, so your team gets instant answers to "have we seen this breach pattern before?" and "which products and branches does this exposure touch?" — without changing how you work today.

What you can do with the centralized database

01

Detect compliance-breach signs early

Flag accounts and processes trending toward past-finding patterns, so issues are caught in internal review — not in the regulator's inspection.

02

Check exposure across products and branches

When one incident surfaces, instantly see every account, product, and branch sharing the same process or control gap and judge the full exposure.

03

Verify remediations actually held

Track whether the same finding recurred across similar operations after each remediation — evidence you can show auditors and regulators.

04

Make approval decisions with full precedent

Surface similar past cases and their rulings at judgment time, so decisions are consistent, defensible, and audit-ready.

"When the regulator asked how we handled similar cases over five years, the answer used to take a task force two weeks. Now it's a single query."

Head of Compliance - Regional bank

See it with your own data

We start with a focused PoC using your existing risk records — findings registers, incident logs, complaint files, as they are. No system migration, no process change required.
