

Turn scattered fraud signals into a **decision-ready** knowledge base

The Problem

Your fraud knowledge — alert histories, dispute cases, chargeback records, investigation notes, rule-change logs — is scattered across dashboards, case tools, and analysts' spreadsheets, and locked in your senior investigators' heads. Connecting a new alert to a known fraud ring takes days; decision quality depends on who picks up the case.

What Neuron Does

It links every record into one ontology-structured database anchored to each transaction and dispute ID, so your team gets instant answers to "does this pattern match a past fraud cluster?" and "which merchants and users share these traits?" — without changing how you work today.

What you can do with the centralized database

01

Detect fraud patterns before losses scale

Flag transactions that pass rules but trend toward past-fraud patterns — device, velocity, merchant traits — so rings are caught at the first case, not the hundredth.

02

Check exposure across the portfolio

When one dispute confirms fraud, instantly see every account, merchant, and transaction sharing the same fingerprint and judge the full exposure.

03

Verify rule changes actually worked

Track whether the same fraud class recurred — and how false positives moved — after each rule or model update, with evidence for risk committees and partners.

04

Resolve disputes with full context

Surface the customer's history and similar past cases at decision time, so outcomes are fast, consistent, and defensible to schemes and regulators.

"An analyst spotted a pattern that matched a fraud ring from eight months ago — something only our most senior investigator would have remembered. The database remembered for us."

Head of Risk Operations - Payments fintech

See it with your own data

We start with a focused PoC using your existing case data — dispute exports, investigation notes, rule logs, as they are. No system migration, no process change required.
