

Turn scattered exception records into a **decision-ready** knowledge base

The Problem

Your operational knowledge — delay reports, damage claims, carrier scorecards, exception logs, customs issues — is scattered across TMS exports, emails, and carrier portals, and locked in your veteran dispatchers' heads. Tracing why a lane keeps failing takes days; recovery decisions depend on who's at the desk.

What Neuron Does

It links every record into one ontology-structured database anchored to each shipment and order ID, so your team gets instant answers to "what caused delays on this lane before?" and "which shipments share this risk right now?" — without changing how you work today.

What you can do with the centralized database

01

Detect disruption signs before they cascade

Flag lanes and carriers trending toward past-failure patterns — weather windows, port congestion, handoff gaps — so replanning starts before the miss.

02

Check exposure across lanes and carriers

When one shipment fails, instantly see every in-transit order sharing the same route, carrier, or handling point and judge the full customer impact.

03

Verify corrective actions actually worked

Track whether the same exception class recurred after each carrier review or process change — evidence for QBRs and customer commitments.

04

Make recovery decisions with full context

Surface similar past disruptions and what actually recovered them at decision time, so expensive expedites are used where they work.

"The same lane failed the same way every rainy season, and every year we treated it as a surprise. The pattern was in our data all along — now it's in front of us."

Logistics Operations Manager - 3PL provider

See it with your own data

We start with a focused PoC using your existing operational data — exception logs, claims, carrier reports, as they are. No system migration, no process change required.
