

Turn scattered quality data into a **decision-ready** knowledge base

The Problem

Your quality knowledge — past troubles, inspection results, complaint memos, photos, countermeasures — is scattered across Excel files and folders, and locked in your veterans' heads. Finding a similar past case takes hours; judgment quality depends on who's on shift.

What Neuron Does

It links every record into one ontology-structured database anchored to each product's serial or lot number, so your team gets instant answers to "what happened under these conditions before?" and "where else does this defect impact?" — without changing how you work today.

What you can do with the centralized database

01

Detect defect signs before shipment

Flag units that pass spec but trend toward past-return patterns, so risks are caught before they leave the factory — not after the claim comes in.

02

Check risk at the lot level

When one unit shows a defect, instantly see variation and re-inspection rates across the same lot and judge the full exposure.

03

Verify countermeasures actually worked

Track whether the same defect recurred across similar products, processes, and customers after each corrective action — evidence you can show customers and management.

04

Make shipment decisions with full context

Surface similar past cases and customer-specific checkpoints at judgment time, so nothing gets missed on release day.

"Searching for similar past defects used to take half a day across old Excel files. Now it takes minutes — and we catch connections we would have missed entirely."

Quality Assurance Manager - Precision components manufacturer

See it with your own data

We start with a focused PoC using your existing quality files — Excel sheets, reports, photos, as they are. No system migration, no process change required.
