

Turn scattered program records into a **decision-ready** knowledge base

The Problem

Your organizational knowledge — program reports, grant applications, M&E data, beneficiary feedback, donor correspondence — is scattered across drives, spreadsheets, and staff inboxes, and lost with every project cycle and staff transition. Proving what worked to a funder takes weeks of reconstruction; program design repeats old mistakes.

What Neuron Does

It links every record into one ontology-structured database anchored to each program and grant ID, so your team gets instant answers to "what outcomes did similar interventions produce?" and "which grants does this requirement change affect?" — without changing how you work today.

What you can do with the centralized database

01

Detect off-target signs early

Flag programs whose indicators trend toward past-underperformance patterns, so course corrections happen mid-cycle — not in the final report.

02

Check impact across grants and programs

When one funder changes a requirement or one risk emerges in the field, instantly see every grant, program, and site affected and judge the full exposure.

03

Verify interventions actually produced outcomes

Track whether similar interventions produced results across sites and cycles — the evidence funders increasingly require.

04

Report and design with full institutional memory

Surface similar past programs, their outcomes, and their lessons at proposal time, so new staff write from the organization's full history.

"Our best evidence for a major grant renewal was in reports written by staff who left years ago. This time, finding it took an afternoon — not a month."

Programs Director - International NGO

See it with your own data

We start with a focused PoC using your existing records — program reports, M&E data, grant files, as they are. No system migration, no process change required.
