

Turn scattered engagement records into a **decision-ready** knowledge base

The Problem

Your firm's knowledge — deliverables, proposals, methodologies, expert notes, engagement post-mortems — is scattered across project folders and personal drives, and walks out the door with every departure. Finding whether the firm has "done this before" takes days; proposal quality depends on who you happen to ask.

What Neuron Does

It links every record into one ontology-structured database anchored to each engagement ID, so your team gets instant answers to "which past engagements match this problem?" and "who solved this, how, and what did it cost?" — without changing how you work today.

What you can do with the centralized database

01

Find precedent engagements instantly

Flag incoming RFPs and scoping calls that match past engagements — by industry, problem, and approach — so proposals start from proven work, not blank pages.

02

Check delivery risk across projects

When one engagement slips, instantly see whether similar scopes, staffing patterns, or client types showed the same trouble before and judge the real risk.

03

Verify methods actually produced outcomes

Track which frameworks and approaches delivered results across similar engagements — evidence for both clients and internal method development.

04

Staff and scope with full context

Surface similar past engagements, their economics, and their lessons at proposal time, so pricing and staffing rest on the firm's full history.

"When our most senior partner retired, clients asked if his expertise left with him. Honestly, most of it stayed — searchable, in his engagement records."

Managing Director - Strategy consulting firm

See it with your own data

We start with a focused PoC using your existing engagement files — deliverables, proposals, post-mortems, as they are. No system migration, no process change required.
