

Turn scattered deal knowledge into a **decision-ready** knowledge base

The Problem

Your investment knowledge — deal memos, DD reports, expert calls, board decks, pass rationales, post-mortems — is scattered across drives, inboxes, and note apps, and locked in individual partners' heads. Recalling why you passed on a similar company three years ago takes days; IC quality depends on who's in the room.

What Neuron Does

It links every record into one ontology-structured database anchored to each company and deal ID, so your team gets instant answers to "have we seen this business model fail before?" and "what did diligence miss in similar deals?" — without changing how you work today.

What you can do with the centralized database

01

Detect red flags matching past deals

Flag pipeline companies whose metrics, team patterns, or market claims mirror past failed or passed deals, so hard questions get asked in the first meeting.

02

Check exposure across the portfolio

When one portfolio company hits a risk — a market shift, a regulation, a channel collapse — instantly see every holding exposed to the same factor and judge the fund-level impact.

03

Verify value-creation plans actually worked

Track which post-investment playbooks produced outcomes across similar companies — evidence for LPs and for your next deal.

04

Make IC decisions with full precedent

Surface every similar past deal, its diligence findings, and its outcome at decision time, so the firm's full history sits at the table.

"A partner left and took ten years of pattern recognition with him — or so we thought. His deal memos and pass notes are now the first thing every associate searches."

Managing Partner - Growth equity firm

See it with your own data

We start with a focused PoC using your existing deal files — memos, DD reports, board materials, as they are. No system migration, no process change required.
