

Turn scattered nonconformance records into a **decision-ready** knowledge base

The Problem

Your quality knowledge — nonconformance reports, MRB dispositions, inspection records, certifications, corrective actions — is scattered across program folders and legacy systems, and locked in your senior inspectors' heads. Reconstructing a part's full history for an audit takes days; disposition quality depends on who reviews it.

What Neuron Does

It links every record into one ontology-structured database anchored to each part serial number and work order, so your team gets instant answers to "where else was this nonconformance seen?" and "what was the disposition rationale last time?" — without changing how you work today.

What you can do with the centralized database

01

Detect nonconformance trends before escapes

Flag processes and part families trending toward past-escape patterns, so quality risks are caught in-house — not in the customer's receiving inspection.

02

Check risk across the fleet and program

When one finding surfaces, instantly see every serial number, program, and delivery sharing the same process or material and judge the full exposure.

03

Verify corrective actions actually worked

Track whether the same nonconformance recurred across programs and suppliers after each CAPA — evidence you can show primes, auditors, and the DCMA.

04

Make disposition decisions with full traceability

Surface similar past MRB cases and their rationale at judgment time, so dispositions are consistent, defensible, and audit-ready.

"Preparing part history for a customer audit used to take a week of pulling records. Now full traceability from raw material to delivery is one query."

Quality Director - Aerostructures manufacturer

See it with your own data

We start with a focused PoC using your existing quality records — NCRs, inspection sheets, MRB minutes, as they are. No system migration, no process change required.

Let's talk for 30 minutes. →
