

Turn scattered claims records into a **decision-ready** knowledge base

The Problem

Your claims knowledge — claim files, adjuster notes, photos, medical or repair reports, fraud flags, settlement histories — is scattered across core systems, shared drives, and paper archives, and locked in your veteran adjusters' heads. Finding how a similar claim was assessed takes hours; payout consistency depends on who handles the file.

What Neuron Does

It links every record into one ontology-structured database anchored to each policy and claim number, so your team gets instant answers to "how were similar claims settled before?" and "does this pattern match known fraud?" — without changing how you work today.

What you can do with the centralized database

01

Detect fraud signs before payout

Flag claims that look routine but trend toward past-fraud patterns — repeat actors, staged-loss traits, provider anomalies — so investigation starts before the check is cut.

02

Check exposure across the book

When one claim reveals a systemic cause — a product defect, a weather event, a provider — instantly see every policy exposed to the same cause and judge the full liability.

03

Verify underwriting changes actually worked

Track whether the same loss pattern recurred across similar policies after each pricing or condition change — evidence you can show actuaries and reinsurers.

04

Make settlement decisions with full precedent

Surface similar past claims and their outcomes at assessment time, so payouts are consistent, fast, and defensible.

"Two adjusters could assess the same claim a thousand dollars apart. Now both see the same twenty precedent cases before they decide."

Claims Department Manager - P&C insurer

See it with your own data

We start with a focused PoC using your existing claims files — assessments, adjuster notes, photos, as they are. No system migration, no process change required.
