

Turn scattered campaign results into a **decision-ready** knowledge base

The Problem

Your marketing knowledge — campaign results, briefs, creative tests, audience learnings, post-mortems — is scattered across ad platforms, decks, and departed employees' drives. Recalling what actually worked for a similar launch takes days; every new campaign risks repeating an old, expensive lesson.

What Neuron Does

It links every record into one ontology-structured database anchored to each campaign ID, so your team gets instant answers to "what worked for this audience and objective before?" and "which creatives failed this way already?" — without changing how you work today.

What you can do with the centralized database

01

Detect underperformance signs early

Flag live campaigns whose early metrics trend toward past-failure patterns — creative fatigue, audience mismatch, funnel drop-offs — so budget shifts in week one, not week six.

02

Check impact across audiences and channels

When one creative or message underperforms, instantly see every campaign, channel, and segment running the same element and judge the full spend at risk.

03

Verify learnings actually got applied

Track whether documented learnings changed outcomes in subsequent campaigns — evidence that post-mortems produce ROI, not just decks.

04

Plan campaigns with full precedent

Surface every similar past campaign, its results, and its post-mortem at briefing time, so new hires plan with the agency's full memory.

"We ran nearly the same failed campaign twice, three years apart, because the team had turned over. That can't happen when the precedent surfaces at the brief stage."

Marketing Director - Consumer brand

See it with your own data

We start with a focused PoC using your existing campaign data — platform exports, briefs, post-mortems, as they are. No system migration, no process change required.
