

Turn scattered rights records into a **decision-ready** knowledge base

The Problem

Your rights knowledge — contracts, license windows, talent agreements, usage records, archive metadata — is scattered across legal folders, spreadsheets, and legacy databases, and locked in your veteran rights managers' heads. Clearing one asset for reuse takes days of contract archaeology; monetization waits on manual checks.

What Neuron Does

It links every record into one ontology-structured database anchored to each asset and contract ID, so your team gets instant answers to "what can we do with this asset, where, until when?" and "which catalog titles carry this same clause risk?" — without changing how you work today.

What you can do with the centralized database

01

Catch rights conflicts before publication

Flag planned uses that trend toward past-violation patterns — expired windows, territory limits, talent restrictions — before content ships, not after the claim.

02

Check exposure across the catalog

When one clause proves problematic, instantly see every title, episode, and clip governed by the same terms and judge the full catalog exposure.

03

Verify licensing terms actually performed

Track which deal structures and windows produced revenue across similar titles — evidence for the next negotiation.

04

Clear content with full context

Surface every relevant contract, amendment, and past usage decision at clearance time, so archive monetization moves in minutes, not weeks.

"Answering 'can we use this clip?' meant three days in contract PDFs. Now it's a same-hour answer — with every restriction listed."

Rights & Clearances Manager - Broadcast media company

See it with your own data

We start with a focused PoC using your existing records — contracts, rights sheets, usage logs, as they are. No system migration, no process change required.
