

Turn scattered customer signals into a **decision-ready** knowledge base

The Problem

Your customer knowledge — support tickets, churn interviews, feature requests, NPS comments, CS call notes — is scattered across Zendesk, CRM, spreadsheets, and Slack, and locked in your veteran CSMs' heads. Connecting a bug report to the accounts it puts at risk takes days; prioritization depends on who shouts loudest.

What Neuron Does

It links every record into one ontology-structured database anchored to each customer account and ticket ID, so your team gets instant answers to "which accounts hit this issue before?" and "what did churned customers have in common?" — without changing how you work today.

What you can do with the centralized database

01

Detect churn signs before renewal

Flag accounts that look healthy on usage but trend toward past-churn patterns — ticket sentiment, unresolved requests, champion departure — so saves start months earlier.

02

Check exposure at the segment level

When one account reports a critical bug, instantly see every account on the same plan, version, and configuration and judge the full revenue at risk.

03

Verify releases actually resolved complaints

Track whether the same complaint cluster recurred across similar accounts after each release — evidence you can show customers and the product team.

04

Handle escalations with full context

Surface the account's entire history, similar past cases, and what worked at escalation time, so renewals and exec calls never start from zero.

"We used to rediscover the same product complaint five times across five accounts. Now one search shows the pattern, the affected revenue, and how we fixed it last time."

VP Customer Success - B2B SaaS company

See it with your own data

We start with a focused PoC using your existing customer data — ticket exports, CRM notes, survey results, as they are. No system migration, no process change required.
